

ABSTRACT

1        For lost circulation treatment, a lost circulation  
2        additive including a dry mixture of water soluble  
3        crosslinkable polymer, a crosslinking agent, and a  
4        reinforcing material of fibers and/or comminuted plant  
5        materials. The method of forming a lost circulation  
6        fluid includes contacting the additive with water or an  
7        aqueous solution, with a method of conforming the  
8        formation further including the step of injecting the  
9        fluid into the wellbore.
